Risk Score Summary

Inherent and residual values are reproduced from the supplied risk register. The final column explains notable source conditions.

Inherent means before safeguards; residual is the estimate considering existing safeguards. Recorded and implied levels show the register value and its score-band check.

Risk Heat Map Notes

Purpose

Visualize documented inherent risk scores in a 5 × 5 likelihood-impact matrix and retain the register's recorded residual assessment values.

Scoring method

Risk score Likelihood × Impact

The heat map plots inherent likelihood and impact exactly as recorded. A score is therefore the product of the two documented 1–5 values. Residual values are summarized, not re-scored or adjusted by assumptions.

Level	Score range
Low	1–4
Moderate	5–9
High	10–16
Critical	17–25

Assumptions and source handling

Scores and control associations follow the current Risk Register. The heat map displays inherent risk, while the Risk Summary includes residual values. Residual scores are assessment estimates and do not assume that planned remediation has reduced risk.
